CHEMOKINE RECEPTOR BINDING HETEROCYCLIC COMPOUNDS

This application claims priority under 35 U.S.C. 119(e) from Provisional Application 60/232,891 filed 15 September 2000; 60/234,510 filed 22 September 2000; Application 0/233,087 filed 15 September 2000; and Application 60/234,816 filed 22 September 2000. Technical Field

This invention generally relates to novel compounds, pharmaceutical compositions and their use. This invention more specifically relates to novel heterocyclic compounds that bind to chemokine receptors, including CXCR4 and CCR5, and demonstrate protective effects against infection of target cells by a human immunodeficiency virus (HIV).

Background Of The Invention

Approximately 40 human chemokines have been described, that function, at least in part, by modulating a complex and overlapping set of biological activities important for the movement of lymphoid cells and extravasation and tissue infiltration of leukocytes in response to inciting agents (See, for example: P. Ponath, *Exp. Opin. Invest. Drugs*, 7:1-18, 1998; Baggiolini, M. *Nature* 392, 565-568 (1998); Locati et al. *Annu. Rev. Med.* 50, 425-40 (1999)). These *chemotactic cytokines*, or *chemokines*, constitute a family of proteins, approximately 8-10 kDa in size. Chemokines appear to share a common structural motif, that consists of 4 conserved cysteines involved in maintaining tertiary structure. There are two major subfamilies of chemokines: the "CC" or β -chemokines and the "CXC" or α -chemokines. The receptors of these chemokines are classified based upon the chemokine that constitutes the receptor's natural ligand. Receptors of the β -chemokines are designated "CCR" while those of the α -chemokines are designated "CXCR".

Chemokines are considered to be principal mediators in the initiation and maintenance of inflammation (see *Chemokines in Disease* published by Humana Press (1999), Edited by C. Herbert; Murdoch et al. *Blood* 95, 3032-3043 (2000)). More specifically, chemokines have been found to play an important role in the regulation of endothelial cell function, including proliferation, migration and differentiation during angiogenesis and re-endothelialization after injury (Gupta et al., *J. Biol. Chem.*, 7:4282-4287 (1998); Volin et al *Biochem. Biophys Res. Commun.* 242, 46-53 (1998)). Two

specific chemokines have been implicated in the etiology of infection by human immunodeficiency virus (HIV).

In most instances, HIV initially binds via its gp120 envelope protein to the CD4 receptor of the target cell. A conformational change appears to take place in gp120 which
5 results in its subsequent binding to a chemokine receptor, such as CCR5 (Wyatt *et al.*, *Science*, 280:1884-1888 (1998); Rizzuto *et al.* *Science*, 280:1949-1953 (1998); Berger *et al.* *Annu. Rev. Immunol.* 17: 657-700 (1999)). HIV-1 isolates arising subsequently in the infection bind to the CXCR4 chemokine receptor.

Following the initial binding by HIV to CD4, virus-cell fusion results, which is
10 mediated by members of the chemokine receptor family, with different members serving as fusion cofactors for macrophage-tropic (M-tropic) and T cell line-tropic (T-tropic) isolates of HIV-1 (Carroll *et al.*, *Science*, 276: 273-276 1997; Feng *et al.* *Science* 272, 872-877 (1996); Bleul *et al.* *Nature* 382, 829-833 (1996); Oberlin *et al.* *Nature* 382, 833-835 (1996); Cocchi *et al.* *Science* 270, 1811-1815 (1995); Dragic *et al.* *Nature* 381, 667-673 (1996);
15 Deng *et al.* *Nature* 381, 661-666 (1996); Alkhatib *et al.* *Science* 272, 1955-1958, 1996). During the course of infection within a patient, it appears that a majority of HIV particles shift from the M-tropic to the more pathogenic T-tropic viral phenotype (Blaak *et al.* *Proc. Natl. Acad. Sci.* 97, 1269-1274 (2000); Miedema *et al.*, *Immune. Rev.*, 140:35 (1994); Simmonds *et al.* *J. Virol.* 70, 8355-8360 (1996); Tersmette *et al.* *J. Virol.* 62, 2026-2032,
20 1988); Connor, R. L, Ho, D. D. *J. Virol.* 68, 4400-4408 (1994); Schuitemaker *et al.* *J. Virol.* 66, 1354-1360 (1992)). The M-tropic viral phenotype correlates with the virus's ability to enter the cell following binding of the CCR5 receptor, while the T-tropic viral phenotype correlates with viral entry into the cell following binding and membrane fusion with the CXCR4 receptor. Clinical observations suggest that patients who possess genetic mutations
25 in CCR5 appear resistant, or less susceptible to HIV infection (Liu *et al.* *Cell* 86, 367-377 (1996); Samson *et al.* *Nature* 382, 722-725 (1996); Michael *et al.* *Nature Med.* 3, 338-340 (1997); Michael *et al.* *J. Virol.* 72, 6040-6047 (1998); O'Brien *et al.* *Lancet* 349, 1219 (1997); Zhang *et al.* *AIDS Res. Hum. Retroviruses* 13, 1357-1366 (1997); Rana *et al.* *J. Virol.* 71, 3219-3227 (1997); Theodorou *et al.* *Lancet* 349, 1219-1220 (1997). Despite the
30 number of chemokine receptors which have been reported to HIV mediate entry into cells, CCR5 and CXCR4 appear to be the only physiologically relevant coreceptors used by a wide variety of primary clinical HIV-1 strains (Zhang *et al.* *J. Virol.* 72, 9307-9312 (1998); Zhang *et al.* *J. Virol.* 73, 3443-3448 (1999); Simmonds *et al.* *J. Virol.* 72, 8453-8457

(1988)). Fusion and entry of T-tropic viruses that use CXCR4 are inhibited by the natural CXC-chemokine stromal cell-derived factor-1, whereas fusion and entry of M-tropic viruses that use CCR5 are inhibited by the natural CC-chemokines namely, Regulated on Activation Normal T-cell Expressed and Secreted (RANTES) and Macrophage
 5 Inflammatory proteins (MIP-1 alpha and beta).

In addition to serving as a co-factor for HIV entry, the direct interaction of virus-associated gp120 with CXCR4 has been recently suggested as a possible cause of CD8⁺ T-cell apoptosis and AIDS-related dementia via induction of neuronal cell apoptosis (Hesselgesser et al. *Curr. Biol.* 8, 595-598 (1998); Hesselgesser et al. *Curr. Biol.* 7, 112-
 10 121 (1997); Hesselgesser et al. "Chemokines and Chemokine receptors in the Brain" in *Chemokines in Disease* published by Humana Press (1999), Edited by C. Herbert; Herbein et al. *Nature* 395, 189-194 (1998); Buttini et al. *Nature Med.* 4, 441-446 (1998); Ohagen et al. *J. Virol.* 73, 897-906 (1999); Biard-Piechaczyk et al. *Virology* 268, 329-344 (2000); Sanders et al. *J. Neuroscience Res.* 59, 671-679 (2000); Bajetto et al. *J. Neurochem.* 73,
 15 2348-2357 (1999); Zheng et al. *J. Virol.* 73, 8256-8267 (1999)).

However, the binding of chemokine receptors to their natural ligands appears to serve a more evolutionary and central role than only as mediators of HIV infection. The binding of the natural ligand, pre-B-cell growth-stimulating factor/stromal cell derived factor (PBSF/SDF-1) to the CXCR4 chemokine receptor provides an important signaling
 20 mechanism: CXCR4 or SDF-1 knock-out mice exhibit cerebellar, cardiac and gastrointestinal tract abnormalities and die *in utero* (Zou et al., *Nature*, 393:591-594 (1998); Tachibana et al., *Nature*, 393:591-594 (1998); Nagasawa et al. *Nature* 382, 635-638 (1996)). CXCR4-deficient mice also display hematopoietic defects (Nagasawa et al. *Nature* 382, 635-638 (1996)); the migration of CXCR4 expressing leukocytes and
 25 hematopoietic progenitors to SDF-1 appears to be important for maintaining B-cell lineage and localization of CD34⁺ progenitor cells in bone marrow (Bleul et al. *J. Exp. Med.* 187, 753-762 (1998); Viardot et al. *Ann. Hematol.* 77, 195-197 (1998); Auiti et al. *J. Exp. Med.* 185, 111-120 (1997); Peled et al. *Science* 283, 845-848 (1999); Qing et al. *Immunity* 10, 463-471 (1999); Lataillade et al. *Blood* 95, 756-768 (1999); Ishii et al. *J. The signal provided by SDF-1 on binding to CXCR4 may also play an important role in tumor cell proliferation and regulation of angiogenesis associated with tumor growth

Oncol.* 69, 99-104 (1998)); the known angiogenic growth factors VEG-F and bFGF, up-regulate levels of CXCR4 in endothelial cells, and SDF-1 can induce neovascularization *in vivo* (Salcedo et al. *Am. J. Pathol.* 154, 1125-1135 (1999)); Leukemia cells that express CXCR4 migrate and adhere to lymph nodes and bone marrow stromal cells that express SDF-1 (Burger et al. *Blood* 94, 3658-3667 (1999); Arai et al. *Eur. J. Haematol.* 64, 323-332 (2000); Bradstock et al. *Leukemia* 14, 882-888 (2000)).
- 10 The binding of SDF-1 to CXCR4 has also been implicated in the pathogenesis of atherosclerosis (Abi-Younes et al. *Circ. Res.* 86, 131-138 (2000)), renal allograft rejection (Eitner et al. *Transplantation* 66, 1551-1557 (1998)), asthma and allergic airway inflammation (Yssel et al. *Clinical and Experimental Allergy* 28, 104-109 (1998); *J. Immunol.* 164, 5935-5943 (2000); Gonzalo et al. *J. Immunol.* 165, 499-508 (2000)),
- 15 Alzheimers disease (Xia et al. *J. Neurovirology* 5, 32-41 (1999)) and Arthritis (Nanki et al. *J. Immunol.* 164, 5010-5014 (2000)).

- In attempting to better understand the relationship between chemokines and their receptors, recent experiments to block the fusion, entry and replication of HIV via the CXCR4 chemokine receptor were carried out through the use of monoclonal antibodies or
- 20 small molecules that appear to suggest a useful therapeutic strategy (Schols et al., *J. Exp. Med.* 186:1383-1388 (1997); Schols et al., *Antiviral Research* 35:147-156 (1997); Bridger et al. *J. Med. Chem.* 42, 3971-3981 (1999); Bridger et al. "Bicyclam Derivatives as HIV Inhibitors" in *Advances in Antiviral Drug Design* Volume 3, p161-229; Published by JAI press (1999); Edited by E. De Clercq). Small molecules, such as bicyclams, appear to
- 25 specifically bind to CXCR4 and not CCR5 (Donzella et al., *Nature Medicine*, 4:72-77 (1998)). These experiments demonstrated interference with HIV entry and membrane fusion into the target cell *in vitro*. More recently, bicyclams were also shown to inhibit fusion and replication of Feline Immunodeficiency Virus (FIV) that uses CXCR4 for entry (Egberink et al. *J. Virol.* 73, 6346-6352 (1999)).

- 30 Additional experiments have shown that the bicyclam dose-dependently inhibits binding of 125I-labeled SDF-1 to CXCR4 and the signal transduction (indicated by an increase in intracellular calcium) in response to SDF-1. Thus, the bicyclam also functioned as an antagonist to the signal transduction resulting from the binding of stromal derived

factor or SDF-1 α , the natural chemokine to CXCR4. Bicyclams also inhibited HIV gp120 (envelope)-induced apoptosis in non-HIV infected cells (Blanco et al. *Antimicrobial Agents and Chemother.* 44, 51-56 (2000)).

U.S. Pat. Nos. 5,583,131; 5,698,546; 5,817,807; 5,021,409; and 6,001,826 which
5 are herein incorporated in their entirety by reference, disclose cyclic compounds that are active against HIV-1 and HIV-2 in *in vitro* tests. It was subsequently discovered and further disclosed in copending application U.S. Serial No. 09/111,895 and U.S. Serial No. 60/172,153 that these compounds exhibit anti-HIV activity by binding to the chemokine receptor CXCR4 expressed on the surface of certain cells of the immune system. This
10 competitive binding thereby protects these target cells from infection by HIV which utilize the CXCR4 receptor for entry. In addition, these compounds antagonize the binding, signaling and chemotactic effects of the natural ligand for CXCR4, the chemokine stromal cell-derived factor 1 α (SDF-1). We further disclosed that these novel compounds demonstrate protective effects against HIV infection of target cells by binding *in vitro* to
15 the CCR5 receptor.

Additionally we have disclosed in U.S. Serial No. 09/495,298 that these cyclic polyamine antiviral agents described in the above-mentioned patents have the effect of enhancing production of white blood cells as well as exhibiting antiviral properties. Thus, these agents are useful for controlling the side-effects of chemotherapy, enhancing the
20 success of bone marrow transplantation, enhancing wound healing and burn treatment, as well as combating bacterial infections in leukemia.

More recently, we disclosed in U.S. Serial No. 09/535,314, a series of heterocyclic compounds that exhibit anti-HIV activity by binding to the chemokine receptors CXCR4 and CCR5 expressed on the surface of certain cells of the immune system. This competitive
25 binding thereby protects these target cells from infection by HIV which utilize the CXCR4 or CCR5 receptors for entry. In addition, these compounds antagonize the binding, signaling and chemotactic effects of the natural ligand for CXCR4, the chemokine stromal cell-derived factor 1 α (SDF-1) and/or the natural ligand for CCR5, the chemokine RANTES.

30 Herein, we disclose novel compounds that exhibit protective effects against HIV infection of target cells by binding to chemokine receptor CXCR4 or CCR5 in a similar manner to the previously disclosed macrocyclic compounds. In addition, these compounds antagonize the binding, signaling and chemotactic effects of the natural ligand for CXCR4,

the chemokine stromal cell-derived factor 1 α (SDF-1) and/or the natural ligand for CCR5, the chemokine RANTES.

Thus the compounds affect chemokine receptors, such as CCR1, CCR2, CCR3, CCR4, CCR5, CCR6, CCR7, CCR8 and CXCR1, CXCR2, CXCR3, CXCR4 and CXCR5 where such chemokine receptors have been correlated as being important mediators of many human inflammatory as well as immunoregulatory diseases and cancer, and modulate the activity of such chemokine receptors so as to be useful for the treatment or prevention of such diseases.

In particular, the compounds of Formula 1 have protective effects on target cells from HIV infection in a manner as to bind specifically to the chemokine receptor.

The term "modulators" as used herein is intended to encompass antagonist, agonist, partial antagonist, and or partial agonist, inhibitors, and activators. In the preferred embodiment of the present invention, compounds of Formula 1 demonstrate protective effects against HIV infection by inhibiting the binding of HIV to a chemokine receptor such as CXCR4 and/or CCR5 of a target cell. The invention includes a method which comprises contacting the target cell with an amount of the compound which is effective at inhibiting binding to the chemokine receptor.

The term "therapeutically effective amount" means the amount of the subject compound that will elicit a biological or medical response in a cell, tissue, organ, system, animal or human that is being sought by the researcher, veterinarian, medical doctor or other clinician.

The term "administration" and or "administering" of the subject compound should be understood to mean as providing a compound of the invention including a pro-drug of a compound of the invention to the individual in need of treatment.

30 In the treatment or prevention of conditions which require chemokine receptor modulation an appropriate dosage level will generally be about 0.01 to 500 mg per kg patient body weight per day which can be administered in single or multiple doses. Preferably, the dosage level will be about 0.1 to about 250 mg/kg per day. It will be

understood that the specific dose level and frequency of dosage for any particular patient may be varied and will depend upon a variety of factors including the activity of the specific compound used, the metabolic stability and length of action of that compound, the age, body weight, general health, sex, diet, mode and time of administration, rate of
5 excretion, drug combination, the severity of the particular condition, and the patient undergoing therapy.

To a solution of (1-*tert*-butoxycarbonyl-1*H*-Benzimidazol-2-ylmethyl)-(5,6,7,8-
10 tetrahydro-quinolin-8-yl)-amine (or amine) (1-1.4 equivalents), *N,N*-diisopropylethylamine (or K_2CO_3) (1.5-2 equivalents) and KI (0.05-0.16 equivalent) in CH_3CN (concentration ~0.1-0.2 M) was added the mesylate or alkyl chloride (such as 1-*N*-*tert*-butoxycarbonyl-2-chloromethylbenzimidazole) (1-1.4 equivalents) and the mixture stirred at 50-70 °C for 3-25 hours, as monitored by analytical thin layer chromatography.
15 The reaction mixture was cooled, diluted with CH_2Cl_2 (10 mL/mmol amine) and poured into either saturated aqueous $NaHCO_3$ or brine (10 mL/mmol alcohol). The phases were separated and the aqueous phase extracted with CH_2Cl_2 (3 x 10 mL/mmol amine). The combined organic phases were dried (Na_2SO_4 or $MgSO_4$) and concentrated under reduced pressure. The crude material was purified by chromatography to afford the desired *N*-alkylated product.
20

General Procedure A: Direct Reductive Amination with $NaBH_3CN$

To a stirred solution of the amine (1 equivalent) in anhydrous methanol (concentration ~0.1 M), at room temperature, was added the carbonyl compound (~1-2 equivalents) in one
25 portion. Once the carbonyl had dissolved (~5 minutes), $NaBH_3CN$ (~2-4 equiv.) was added in one portion and the resultant solution was stirred at room temperature. The solvent was removed under reduced pressure and CH_2Cl_2 (20 mL/mmol of amine) and brine or 1.0 M aqueous $NaOH$ (10 mL/mmol amine) were added to the residue. The phases were separated and the aqueous phase was extracted with CH_2Cl_2 (3 x 10 mL/mmol
30 amine). The combined organic phases were dried (Na_2SO_4) and concentrated under reduced pressure. The crude material was purified by chromatography.

General Procedure B: Direct Reductive Amination with NaBH(OAc)₃ or NaBH₄

To a stirred solution of the amine (1 equivalent) in CH₂Cl₂ (concentration ~0.2 M), at room temperature, was added the carbonyl compound (~1-2 equivalents), glacial acetic acid (0-2 equivalents) and NaBH(OAc)₃ (~1.5-3 equivalents) and the resultant solution stirred at room temperature. The reaction mixture was poured into either saturated aqueous NaHCO₃ or 1.0 M aqueous NaOH (10 mL / mmol amine). The phases separated and the aqueous phase extracted with CH₂Cl₂ (3 x 10 mL /mmol amine). The combined organic phases were dried (Na₂SO₄) and concentrated under reduced pressure. The crude material was purified by chromatography.

Similarly, to a stirred solution of the amine (1 equivalent) in anhydrous MeOH (concentration ~0.1 M), at room temperature, was added the carbonyl compound (1 equivalent). The resultant solution was stirred at room temperature or heated to reflux for 4-24 hours. NaBH₄ (1-2 equivalents) was added and the resultant mixture stirred at room temperature for ~20 minutes. The reaction mixture was concentrated, dissolved in CH₂Cl₂, washed consecutively with saturated aqueous NaHCO₃ and saturated aqueous NaCl. The aqueous layers were extracted with CH₂Cl₂ (2x) and the combined organic extracts were dried (MgSO₄) and concentrated.

General Procedure C: Reaction of Alcohols with Methanesulfonyl Chloride

To a stirred solution of the alcohol (1 equivalent) and Et₃N (1.5-2 equivalents) in CH₂Cl₂ (or THF) (concentration ~0.1 M) at room temperature (or 0 °C) was added methanesulfonyl chloride (~1.5 equivalents) and the reaction stirred at room temperature for 0.5-1 h. The reaction mixture was poured into either saturated aqueous NaHCO₃ or saturated NH₄Cl (10 mL/mmol alcohol). The phases were separated and the aqueous phase extracted with CH₂Cl₂ (3 x 10 mL/mmol amine). The combined organic phases were dried (Na₂SO₄) and concentrated under reduced pressure. The crude material was either purified by chromatography or used without further purification in the N-alkylation step.

General Procedure D: Salt formation using saturated HBr(g) in acetic acid:

To a solution of the free base in glacial acetic acid (2 mL) was added, a saturated solution of HBr(g) in acetic acid (2 mL). A large volume of ether (25 mL) was then added to precipitate a solid, which was allowed to settle to the bottom of the flask and the supernatant solution was decanted. The solid was washed by decantation with ether (3 x 25

mL) and the remaining traces of solvent were removed under vacuum. For additional purification, the solid was dissolved in methanol and re-precipitated with a large volume of ether. Washing the solid with ether by decantation, followed by drying of the solid *in vacuo* (0.1 Torr) gave the desired compound.

25 5,6,7,8-tetrahydro-quinolin-8-yl-amine (hydrochloride salt).

Preparation of 2-(phthalamido-methyl)-benzaldehyde:

To a stirred, cooled (0 °C) solution of 2-cyanobenzaldehyde (10.4 g, 79.0 mmol) in anhydrous THF (320 mL) was added LAH (14.3 g, 377 mmol) portionwise. The slurry was stirred under N₂ at room temperature for 15 h. The reaction was slowly quenched with
5 distilled water (15 mL), then 15% (w/v) NaOH (15 mL) followed by more distilled water (45 mL). The mixture was stirred for 20 min, diluted with diethyl ether (200 mL) and the white fluffy precipitate was removed by filtration. The filtrate was dried (MgSO₄) and concentrated *in vacuo*. The resultant amino alcohol (12.6 g) was used without further purification in the next reaction.

10 A solution of the alcohol from above (assumed 79 mmol) and phthalic anhydride (12.3 g, 83 mmol) in 20% MeOH/CHCl₃ (200 mL) was stirred at reflux for 19 h. The mixture was cooled to room temperature and purified by flash chromatography (8 cm id., 300 g silica gel, eluted with 1% MeOH/CH₂Cl₂) followed by recrystallization from hot dichloromethane to give the desired alcohol as a pale pink solid (7.11 g, 34% over two
15 steps).

To a stirred slurry of TPAP (465 mg, 1.3 mmol), NMO (4.7 g, 40 mmol) and 3Å molecular sieves (14 g) in CH₂Cl₂ (220 mL) was added dropwise a solution of the alcohol from above (7.11 g, 27 mmol) in CH₂Cl₂ (50 mL) over 30 min. The black slurry was stirred under N₂ for 40 min after the addition, concentrated *in vacuo*, and purified by flash
20 chromatography (8 cm id., 300 g silica gel, eluted with EtOAc) to afford the pure title compound as a white solid (5.75 g, 82%). ¹H NMR (CDCl₃) δ 5.38 (s, 2H), 7.24-7.28 (m, 1H), 7.44-7.54 (m, 2H), 7.74-7.78 (m, 2H), 7.85-7.92 (m, 3H), 10.35 (s, 1H).

Preparation of 1-[N-(t-butoxycarbonyl)-aminomethyl]-3-hydroxymethyloxazole:

Using the procedure of P. Wipf et al. (A.J. Phillips, Y. Uto, P. Wipf, M. J. Reno and
 20 D. R. Williams *Org. Lett.* 2000, 2(8), 1165-1168), a -20 °C solution of N-(t-butoxycarbonyl)-Gly-Ser-OMe (170 mg, 0.615 mmol) in dichloromethane (5 mL) was treated with bis(2-methoxyethyl)aminosulfur trifluoride (0.125 mL, 0.677 mmol). The resulting solution was then stirred at -20 °C for 30 minutes, and bromotrichloromethane (0.212 mL, 2.21 mmol) was added, followed by DBU (0.330 mL, 2.21 mmol). The
 25 reaction was allowed to warm to 0 °C, and was stirred at that temperature for 5 hours, then aqueous ammonium chloride (5 mL) was added. After separation of the aqueous and organic layers, the aqueous layer was extracted twice with dichloromethane. The combined organic fractions were then dried over anhydrous sodium sulfate and concentrated. Purification by chromatography on silica gel (2% methanol in dichloromethane), gave
 30 methyl-1-[N-(t-butoxycarbonyl)-aminomethyl]-oxazole-3-carboxylate as an oil (123 mg,

78%). ¹H NMR (CDCl₃) δ 1.25 (s, 9H), 3.88 (s, 3H), 4.51 (d, 2H, *J* = 5.8 Hz), 5.22 (br s, 1H), 8.19 (s, 1H).

The ester (178 mg, 0.695 mmol) in 0 °C dichloromethane (8 mL) was treated with DIBAL-H (1 M in dichloromethane, 2.08 mL, 2.08 mmol). The mixture was then stirred at 0 °C for 2 hours before being treated with aqueous 5% sodium potassium tartrate (8 mL). The mixture was stirred rapidly for 30 minutes (until the aqueous and organic layers clarified), and the layers were then separated. The aqueous layer was extracted twice with dichloromethane. The combined organic fractions were then dried over anhydrous sodium sulfate and concentrated. Purification by chromatography on silica gel (5% methanol in dichloromethane) gave 1-[*N*-(*t*-butoxycarbonyl)-aminomethyl]-3-hydroxymethyloxazole as an oil (45 mg, 28%). ¹H NMR (CDCl₃) δ 1.40 (s, 9H), 4.43 (d, 2H, *J* = 5.6 Hz), 4.56 (s, 2H), 5.37 (s, 1H), 7.54 (s, 1H).

To a stirred solution of 1-[*N*-(*t*-butoxycarbonyl)-aminomethyl]-3-hydroxymethyloxazole (45 mg, 0.197 mmol) in dichloromethane (5 mL) was added triethylamine (0.055 mL, 0.4 mmol) followed by methanesulfonyl chloride (0.023 mL, 0.3 mmol). The resultant solution was stirred at room temperature for 20 minutes, before being treated with an aqueous saturated ammonium chloride solution (5 mL). The aqueous layer was extracted twice with dichloromethane. The combined organic fractions were then dried over anhydrous sodium sulfate and concentrated to afford the desired mesylate, which was used directly and immediately in the next reaction without further purification. ¹H NMR (CDCl₃) δ 1.45 (s, 9H), 3.07 (s, 3H), 4.43 (d, 2H, *J* = 5.6 Hz), 5.15 (s, 2H), 7.73 (s, 1H).

Using General Procedure for N-Alkylation, *O*-methanesulfonyl-1-[*N*-(*t*-butoxycarbonyl)-aminomethyl]-3-hydroxymethyloxazole (0.197 mmol) was stirred in 60°C acetonitrile (5 mL) for 4 hours with diisopropylethylamine (0.05 mL, 0.295 mmol) and (1*H*-*N*-*t*-butoxycarbonyl-benzimidazol-2-ylmethyl)-(5,6,7,8-tetrahydroquinolin-8-yl)-amine (95 mg, 0.25 mmol). The reaction was then cooled and concentrated. The residue was taken up in dichloromethane and extracted with aqueous ammonium chloride, dried, concentrated and purified by chromatography on silica gel (20:1 dichloromethane:methanol) to afford [*N*-(*t*-butoxycarbonyl)-benzimidazol-2-ylmethyl]-

25 Preparation of 2,5-bis-(hydroxymethyl)-*N*-benzylimidazole:

Using the procedure of S. Zimmerman et al. (S.C. Zimmerman, K.D. Cramer and A.A. Galan *J. Org. Chem.* 1989, 54, 1256-1264) N-Benzylimidazole (15g, 95 mmol) was treated with formaldehyde (60 mL of a 37% aqueous solution), to which glacial acetic acid

The resulting mixture was stirred until homogeneous, then was transferred to a thick-walled glass tube, which was sealed and placed in a 140 °C oil bath for 12 hours. The tube was then cooled, concentrated, made basic with 10N NaOH, and extracted twice with a 10:1 isopropanol:chloroform mixture. The combined organic fractions were then dried over anhydrous sodium sulfate and
10 concentrated. Purification by chromatography on silica gel (7% methanol in dichloromethane) gave 2,5-bis-(hydroxymethyl)-N-benzylimidazole as a white crystalline solid (4.9g, 24%). ¹H NMR (CDCl₃) δ 4.41 (s, 2H), 4.48 (s, 2H), 5.36 (s, 2H), 6.77 (s, 1H), 7.00 (m, 2H), 7.28 (m, 3H).

The mixture was then stirred overnight (16h) at room temperature. The reaction was then washed with aqueous ammonium chloride and the layers separated. The aqueous layer was extracted twice with dichloromethane. The

Purification by chromatography on silica gel (5% methanol in dichloromethane) gave the monoacetate, 2-acetoxymethyl-5-hydroxymethyl-N-benzylimidazole, as a white powder (300 mg, 58%). ¹H NMR (CDCl₃) δ 1.83 (s, 3H), 4.49 (s, 2H), 5.06 (s, 2H), 5.33 (s, 2H), 6.97 (m, 2H), 7.28 (m, 3H).

The resultant solution was stirred at room temperature for 20 minutes, before being treated with an aqueous saturated
30 ammonium chloride solution (5 mL). The aqueous layer was extracted twice with

dichloromethane. The combined organic fractions were then dried over anhydrous sodium sulfate and concentrated to afford the desired mesylate, which was used directly and immediately in the next reaction without further purification. ¹H NMR (CDCl₃) δ 1.86 (s, 3H), 4.44 (s, 2H), 5.18 (s, 2H), 5.29 (s, 2H), 6.97 (m, 2H), 7.33 (m, 3H).

AMD11071: Preparation of 2-Aminomethyl-5-[[1H-benzimidazol-2-ylmethyl]-(5,6,7,8-tetrahydro-quinolin-8-yl)-amino]-methyl-phenol (hydrobromide salt).

2-Hydroxy-4-methylbenzonitrile was prepared following a modification of the procedure reported by Makoto Adachi and Tsutomu Sugawara (*Synthetic Communications* 1990, 20, 71-84.). To a cold (0 °C) solution of BCl₃ (1.0 M in heptane, 12.0 mL, 12.0 mmol) in 1,2-dichloroethane was added neat *m*-cresol (1.00 mL, 9.56 mmol) followed by CH₃SCN (0.83 mL, 12.1 mmol) and AlCl₃ (1.38 g, 10.4 mmol). The cooling bath was removed and the resultant mixture was heated to 80 °C for 3 hours then cooled to room temperature. The mixture was poured into 4 N NaOH (35 mL) and the mixture was heated at 80 °C for 45 minutes then cooled to room temperature. The phases were separated and the aqueous phase was extracted with CH₂Cl₂ (3 x 50 mL). The aqueous phase was acidified with 6 N HCl (30 mL) and extracted with diethyl ether (3 x 50 mL). The combined ether extracts were dried (MgSO₄) and concentrated. Purification of the crude material by column chromatography on silica gel (20:1 CH₂Cl₂-EtOAc) provided 1.16 g (91%) of 2-Hydroxy-4-methylbenzonitrile as a white solid. ¹H NMR (CDCl₃) δ 2.36 (s, 3H), 6.20 (br s, 1H), 6.79-6.81 (m, 2H), 7.38 (d, 1H, *J* = 9 Hz).

To a solution of 2-Hydroxy-4-methylbenzonitrile (0.563 g, 4.23 mmol) in CH₂Cl₂ (21 mL) was added acetic anhydride (0.60 mL, 6.36 mmol) followed by triethylamine (1.20 mL, 8.61 mmol) and the resultant solution was stirred at room temperature for 30 minutes. The mixture was diluted with CH₂Cl₂ (60 mL), washed with saturated aqueous NaHCO₃ (20 mL) and brine (2 x 20 mL). The organic phase was dried (Na₂SO₄) and concentrated and provided 0.72 g (97%) of (2-cyano-5-methyl-phenyl) acetate as a white solid. ¹H NMR (CDCl₃) δ 2.38 (s, 3H), 2.43 (s, 3H), 7.08 (s, 1H), 7.13 (d, 1H, *J* = 9 Hz), 7.54 (d, 1H, *J* = 9 Hz).

Following the General Procedure for *N*-alkylation, the 3:1 mixture of mixture 4-methyl-isophthalonitrile and 4-bromomethyl-isophthalonitrile obtained from the previous step (457 mg) and (1*H*-*N*-*tert*-butoxycarbonyl-benzimidazol-2-ylmethyl)-(5,6,7,8-tetrahydroquinolin-8-yl)-amine (257 mg, 0.63 mmol) were converted into the

Preparation of 2-[[[2,4-Bis-(*tert*-butoxycarbonylamino-methyl)-benzyl)-(5,6,7,8-tetrahydro-quinolin-8-yl)-amino]-methyl]-benzoimidazole-1-carboxylic acid *tert*-butyl ester:

A hydrogenation flask was charged with a 50% slurry of Raney nickel in water (300 mg), which was then washed with methanol (3 x 10 mL). A solution of 2-[[[2,4-dicyano-benzyl)-(5,6,7,8-tetrahydro-quinolin-8-yl)-amino]-methyl]-benzoimidazole-1-carboxylic acid *tert*-butyl ester (326 mg, 0.63 mmol) in MeOH (10 mL) was then added, and NH₃ gas was bubbled through the solution for 5 min. The resulting heterogeneous mixture was hydrogenated (50 psi) on a Parr Shaker for 18 h; at this time, the crude mixture was filtered
 20 through celite, washed with MeOH (3 x 20 mL), and concentrated in vacuo. Flash chromatography (silica gel, 20:2:1 CH₂Cl₂-MeOH-NH₄OH, then 10:1 MeOH-NH₄OH) of the resulting material afforded 124 mg (46%) of the free base of AMD9923 as a white solid; however, combustion analysis revealed that this material was contaminated with

silica gel, and repeated filtration and chromatography (celite, florisil, silica gel, basic alumina) failed to remove the contaminant. Thus, this compound (60 mg, 0.14 mmol) was taken up in a mixture of THF (5 mL), MeOH (1 mL) and water (3 drops) then di-*tert*-butyl dicarbonate (92 mg, 0.42 mmol) was added. The resulting solution was stirred 2 h, at which point saturated aqueous sodium bicarbonate (5 mL) was added, and the resulting mixture was extracted with CH₂Cl₂ (3 x 10 mL) then the combined organic extracts were dried (MgSO₄), and concentrated in vacuo. Purification of the crude material thus obtained by radial chromatography (silica gel, 1 mm plate, 50:1:1 CH₂Cl₂-MeOH-NH₄OH) afforded 71 mg. Following the general procedure D for concomitant BOC deprotection and HBr salt formation, treatment of the oil from the previous step (71 mg, 0.10 mmol) with HBr-saturated acetic acid (1 mL) afforded 48 mg (60%) of the HBr salt of AMD9923 as a white solid. ¹H NMR (CD₃OD) δ 1.48-1.59 (m, 1H), 2.07-2.14 (m, 2H), 2.29-2.30 (m, 1H), 2.63 (br d, 1H, *J* = 17 Hz), 2.78-2.89 (m, 1H), 3.76 (d, 1H, *J* = 14 Hz), 3.74-4.08 (m, 7H), 4.16 (d, 1H, *J* = 13 Hz), 6.99 (dd, 1H, *J* = 8, 5 Hz), 7.16-7.20 (m, 2H), 7.34-7.39 (m, 3H), 7.54-7.57 (m, 2H), 7.65 (s, 1H), 8.31 (d, 1H, *J* = 5 Hz); ¹³C NMR (CD₃OD) δ 21.3, 22.6, 22.8, 41.8, 43.6, 48.6, 55.7, 60.9, 115.9, 123.4, 123.8, 130.9, 133.2, 134.2, 135.0, 135.8, 136.4, 138.9, 140.2, 147.5, 152.8, 156.6. AMD11175: Preparation of (2-aminomethyl-5-fluorobenzyl)-(1*H*-benzimidazol-2-ylmethyl)-(5,6,7,8-tetrahydro-quinolin-8-yl)-amine (hydrobromide salt).

5 Preparation of 4-fluoro-2-methylbenzonitrile:

A solution of CuCN (4.45 g, 50.0 mmol) and NaCN (3.91 g, 80.0 mmol) in H₂O (15 mL) was heated to 60 °C. A suspension of 4-fluoro-2-methylaniline (5.16 g, 41.2 mmol) in H₂O (20 mL) was acidified with concentrated HCl (10 mL). Additional H₂O (approx. 50 mL) was added until the resulting suspension stirred freely and the mixture was cooled to below 0 °C with an ice/salt water bath. A solution of NaNO₂ (3.19 g, 46.2 mmol) in H₂O (8 mL) was added dropwise along with crushed ice, ensuring that ice was always present in the diazonium salt solution. The mixture was stirred at 0 °C for 15 minutes, then powdered K₂CO₃ (6.62 g, 47.9 mmol) was added portionwise to neutralize the solution. The resulting bright orange solution was then added portionwise to the 60 °C cyanide solution over approx. 40 minutes. The resulting green suspension was heated to 110 °C for 45 minutes and, once cooled to room temperature, saturated aqueous NaHCO₃ (80 mL) was added. Extraction of this thick, black solution with CH₂Cl₂ (150 mL × 3) did not yield any desired material.

An orange solid that was found to have sublimed in the condenser during the reflux portion of the reaction was rinsed out with CH₂Cl₂ (100 mL) and washed with H₂O (50 mL). The aqueous solution was extracted with CH₂Cl₂ (25 mL × 2) and the combined organic solution was dried (MgSO₄), filtered and concentrated under reduced pressure, affording the nitrile as a yellow solid (3.00 g, 22.2 mmol, 54%). ¹H NMR (CDCl₃) δ 2.55 (s, 3H), 6.94-7.04 (m, 2H), 7.60 (dd, 1H, *J* = 8.6, 5.6 Hz). IR (thin film, KBr) ν 2223 cm⁻¹.

25 Preparation of 2-bromomethyl-4-fluorobenzonitrile:

To a solution of the *o*-tolunitrile (1.62 g, 12.0 mmol) in benzene (80 mL) was added NBS (1.33 g, 7.47 mmol) and AIBN (153 mg, 0.93 mmol). The solution was heated at

reflux under nitrogen for 3 hours and a second portion of each of NBS (1.25 g, 7.02 mmol) and AIBN (150 mg, 0.91 mmol) were added. The reaction was heated at reflux for a further 2 hours and, once cooled, the solution was washed with H₂O (80 mL × 2) and brine (80 mL). The organic solution was dried (MgSO₄), filtered and concentrated under reduced pressure. Purification by flash column chromatography on silica (EtOAc/hexane, 1:9) gave the bromide as an orange solid (721 mg, 3.37 mmol, 28%). ¹H NMR (CDCl₃) δ 4.60 (s, 2H), 7.13 (td, 1H, *J* = 8.2, 2.5 Hz), 7.28 (dd, 1H, *J* = 8.9, 2.6 Hz), 7.69 (dd, 1H, *J* = 8.6, 5.3 Hz).

10 Preparation of 2-[[[2-cyano-5-fluorobenzyl)-(5,6,7,8-tetrahydroquinolin-8-yl)-amino]-methyl]-benzimidazole-1-carboxylic acid *tert*-butyl ester:

A solution of the benzyl bromide (263 mg, 1.23 mmol), (1-*tert*-butoxycarbonyl-1*H*-benzimidazol-2-ylmethyl)-(5,6,7,8-tetrahydro-quinolin-8-yl)-amine (381 mg, 1.01 mmol), DIPEA (0.26 mL, 1.5 mmol), and KI (10 mg, 0.06 mmol) in CH₃CN (7 mL) was stirred at 60 °C under nitrogen for 17 hours. Once cooled to room temperature, saturated aqueous NaHCO₃ (10 mL) was added and the mixture was extracted with CH₂Cl₂ (25 mL × 3). The combined organic solution was dried (MgSO₄), filtered and concentrated under reduced pressure. Purification by flash column chromatography on silica (EtOAc/hexane, 1:1) gave the tertiary amine as a pale yellow foam (411 mg, 0.80 mmol, 80%). ¹H NMR (CDCl₃) δ 1.75 (s, 9H), 1.85-2.11 (m, 3H), 2.31-2.41 (m, 1H), 2.64-2.92 (m, 2H), 4.03 (d, 1H, *J* = 16.2 Hz), 4.18 (d, 1H, *J* = 16.2 Hz), 4.34 (dd, 1H, *J* = 10.2, 5.7 Hz), 4.62 (d, 1H, *J* = 14.1 Hz), 4.74 (d, 1H, *J* = 14.1 Hz), 6.55 (td, 1H, *J* = 8.1, 2.7 Hz), 7.00 (dd, 1H, *J* = 7.7, 4.7 Hz), 7.14 (dd, 1H, *J* = 8.4, 5.4 Hz), 7.20 (dd, 2H, *J* = 6.2, 3.2 Hz), 7.23-7.31 (m, 1H), 7.56-7.66 (m, 3H), 8.44 (dd, 1H, *J* = 4.5, 1.2 Hz).

Preparation of 2-[[[(1*H*-benzimidazol-2-ylmethyl)-(5,6,7,8-tetrahydroquinolin-8-yl)-amino]-methyl]-4-fluorobenzonitrile:

To LiOH·H₂O (51 mg, 1.2 mmol) and 10% Pd/C (39 mg, 0.04 mmol) in a 50 mL round bottom flask flushed with nitrogen was added H₂O (2 mL). A solution of the nitrile (201 mg, 0.39 mmol) in dioxane (6 mL) was added followed by Raney-Ni (0.07 mL, 0.6 mmol) as a 50% suspension in H₂O (as described by Klenke, B.; Gilbert, I.H. *J. Org. Preparation of 1-allyl-piperazine:

To a stirred solution of 2,2,2-trifluoro-1-piperazin-1-yl-ethanone (515 mg, 2.83 mmol) in dry CH_3CN (6 mL) was added allyl bromide (0.32 mL, 3.7 mmol) and powdered potassium carbonate (0.78 g, 5.65 mmol) and the mixture stirred overnight. The reaction
5 was concentrated under reduced pressure, diluted with CH_2Cl_2 (30 mL) and water (30 mL) and the aqueous layer extracted with CH_2Cl_2 (2 x 20 mL). The combined organic extracts were dried (Na_2SO_4), filtered and concentrated *in vacuo* to afford the crude di-protected piperazine (0.554 g) which was used without further purification in the next reaction.

To a solution of the TFA-protected piperazine from above (0.554 g) in MeOH (10
10 mL) was added powdered K_2CO_3 (0.689 g, 5.0 mmol) and the mixture stirred at reflux for 1.5 h and at room temperature overnight. The reaction was diluted with CH_2Cl_2 (30 mL) and water (20 mL), the phases separated and the aqueous layer extracted with CH_2Cl_2 (2 x 15 mL). The combined organic extracts were dried (Na_2SO_4), filtered and concentrated *in vacuo* to afford the title compound (0.132 g, 42%) as a pale yellow oil. ^1H NMR (CDCl_3)

AMD9770: Preparation of 4-[[[(1H-Benzimidazol-2-ylmethyl)-(5,6,7,8-tetrahydro-quinolin-8-yl)-amino]-methyl]-benzamide

Preparation of 4-Formylbenzamide:

Neat thionyl chloride (1.94 mL, 27 mmol) was added dropwise to a stirred suspension of 4-formylbenzoic acid (2.0 g, 13 mmol) in dry CH_2Cl_2 (50 mL). The resulting slurry was stirred 18 h, at which time the solvent and excess thionyl chloride was removed *in vacuo*. The residual solid was redissolved in dry THF (50 mL) and ammonia gas was bubbled through the solution for 15 min, which resulted in the formation of a white precipitate. The mixture was poured into saturated aqueous sodium bicarbonate (30 mL) and chloroform (100 mL) was added. The phases were separated and the aqueous layer was extracted with $CHCl_3$ (3 x 30 mL). The combined organic extracts were dried ($MgSO_4$), filtered and concentrated *in vacuo*. Purification of the crude material by flash chromatography on silica gel (20:1:1 CH_2Cl_2 -MeOH- NH_4OH) afforded the title compound (85 mg, 4%) as a white solid. 1H NMR ($CDCl_3$) δ 5.96 (br s, 1H), 6.19 (br 2, 1H), 7.97 (s, 4H), 10.09 (s, 1H).

The resultant

crude material was taken up in neat TFA (2 mL) and stirred 3 h. Saturated aqueous sodium bicarbonate (10 mL) was cautiously added, and the resulting mixture was extracted with CH_2Cl_2 (3 x 20 mL) then the combined organic extracts were dried (MgSO_4), filtered and concentrated *in vacuo*. Preparation of 1H-benzoimidazole-5-carbaldehyde:

LiAlH₄ (1.0 m in THF, 10 mL, 10 mmol) was added dropwise to a suspension of 5-benzimidazolecarboxylic acid (500 mg, 3.08 mmol) in THF (20 mL) at 0 °C. The reaction mixture was warmed to room temperature and stirred for 24 h followed by heating at 50°C for an addition 24 h. MeOH (4 x 5 mL) was added and the solution was concentrated between each addition. The resulting brown syrup was dried *in vacuo* for 3 h. Preparation of 4-(oxazol-2-yl)-benzyl alcohol (B.A. Anderson *et al. J. Org. Chem.* 1997, 62, 8634):

To a solution of oxazole (0.285 mL, 4 mmol) in THF (40mL) at -78°C was added
 10 n-butyllithium (1.83 mL of a 2.4M solution in hexanes, 4.4 mmol) and the reaction stirred
 for 30 min at -78°C then zinc chloride (12 mL of 1M solution in THF, 12 mmol) was
 added. The mixture was then allowed to slowly warm to 0°C and was stirred for 45 min.
 A solution of methyl-4-bromobenzoate (0.860 g, 4 mmol) in THF (10 mL) was added
 followed by a solution of bis-(triphenylphosphine)-palladium (II) chloride (140 mg, 0.2
 15 mmol) and n-butyllithium (0.17 mL of a 2.4M solution in hexanes, 0.4 mmol) in THF (4
 mL). The resultant dark brown mixture was warmed to reflux and stirred for 1 h. After
 cooling, the reaction mixture was diluted with ethyl acetate (30 mL), then washed with
 water (1 x 20 mL) and brine (1 x 20 mL). The organic layer was dried (Na_2SO_4), filtered,
 concentrated and purified by chromatography on silica gel (98:2 $\text{CH}_2\text{Cl}_2/\text{MeOH}$) to give
 20 the desired methyl-4-(oxazol-2-yl)-benzoate (340 mg, 42%) as a yellow oil. ^1H NMR
 (CDCl_3) δ 3.94 (s, 3H), 7.28 (s, 1H), 7.76 (m, 1H), 8.09 (m, 4H).

To a solution of methyl-4-(oxazol-2-yl)-benzoate (0.203 g, 1 mmol) in CH_2Cl_2 (10
 mL) 0°C was added DIBAL-H (4 mL of a 1.0M solution in dichloromethane, 4 mmol)
 over 10 min. The resultant solution was stirred at 0°C for 2 h then quenched with an
 25 aqueous saturated solution of sodium potassium tartrate (20 mL) and the biphasic mixture
 stirred rapidly for 60 min. The phases were separated and the aqueous layer extracted with

CH₂Cl₂ (3 x 10 mL). The combined organic fractions were dried (Na₂SO₄), filtered, concentrated and purified by chromatography on silica gel (10:1 CH₂Cl₂/MeOH) to afford the title alcohol (0.156 g, 89%). ¹H NMR (CDCl₃) δ 3.42 (t, 1H, J = 6.0 Hz (OH)), 4.77 (s, 2H, J = 6.0 Hz), 7.24 (s, 1H), 7.47 (d, 2H, J = 7.8 Hz), 7.71 (s, 1H), 8.05 (d, 2H, J = 7.8 Hz).

10 temperature. The resultant mesylate was obtained as a fine white powder and used directly in the next reaction without further purification. ¹H NMR (CDCl₃) δ 3.00 (s, 3H), 3.67 (s, 2H), 7.26 (s, 1H), 7.51 (d, 2H, J = 8.1 Hz), 7.74 (s, 1H), 8.07 (d, 2H, J = 8.1 Hz).

Preparation of 4-(benzoxazol-2-yl)-benzyl alcohol:

A solution of 2-nitrophenol (0.50 g, 3.6 mmol) and methyl 4-chlorocarbonyl benzoate (0.79 g, 4.0 mmol) in THF (4.5 mL) and pyridine (0.9 mL) was stirred for 1 h at room temperature. The reaction was diluted with saturated sodium bicarbonate (10 mL) and EtOAc (15 mL), the phases separated and the aqueous phase extracted with EtOAc (2 x 10 mL). The combined organic extracts were dried (Na₂SO₄), filtered and concentrated under reduced pressure to afford (2-nitrophenyl)-terephthalic acid diester as a yellow solid (1.03 g, 96%). ¹H NMR (CDCl₃) δ 3.98 (s, 3H), 7.40 (d, 1H, *J* = 7.8 Hz), 7.47 (t, 1H, *J* = 7.8 Hz), 7.74 (t, 1H, *J* = 7.2 Hz), 8.18 (d, 1H, *J* = 7.2 Hz), 8.19 (d, 2H, *J* = 7.8 Hz), 8.27 (d, 2H, *J* = 7.8 Hz).

To a solution of (2-nitrophenyl)-terephthalic acid diester (1.02 g, 3.3 mmol) in glacial acetic acid (11 mL) was added iron powder (<5μm mesh, 0.51 g, 9.0 mmol) and the mixture stirred at reflux for 1.5 h. The mixture was cooled, stirred at room temperature for 2 h and concentrated under reduced pressure. The residue was partitioned between saturated sodium bicarbonate (25 mL) and ethyl acetate (25 mL), the phases separated and the organic layer washed with saturated NaHCO₃ (25 mL). The organic extract was dried (MgSO₄), filtered, concentrated and purified by column chromatography on silica gel (2% MeOH/CH₂Cl₂) to give (2-hydroxyphenyl)-terephthalamic acid methyl ester (0.37 g, 44%). ¹H NMR (CDCl₃) δ 3.98 (s, 3H), 6.95 (t, 1H, *J* = 7.8 Hz), 7.07 (d, 1H, *J* = 7.8 Hz), 7.19 (t, 1H, *J* = 7.8 Hz), 7.28 (d, 1H, *J* = 7.8 Hz), 7.98 (d, 2H, *J* = 8.4 Hz), 8.18 (d, 2H, *J* = 7.8 Hz).

A solution of (2-hydroxyphenyl)-terephthalamic acid methyl ester (0.35 g, 1.3 mmol) in polyphosphoric acid (~5 mL) was heated to reflux for 3 h. The solution was cooled to 0°C, water added (100 mL) and solid K₂CO₃ introduced until pH 7-9 was attained. EXAMPLE 101

Inhibition of chemokine induced Ca flux measured on a FLIPR (Molecular Devices)

30

Reagents:

Loading dye: Fluo-3, AM (Molecular Probes F-1241) is dissolved in anhydrous DMSO and stored frozen in aliquots. To increase the solubility of the dye in the loading

medium, 10% (w/v) pluronic acid (Molecular Probes F-127) is added to the Fluo-3 stock solution immediately before use.

Flux buffer:

HBSS + 20 mM Hepes buffer + 0.2 % BSA, pH 7.4. HBSS 10x [(w/o phenol red
5 and sodium bicarbonate (Gibco 14 065-049)]; Hepes buffer 1M (Gibco 15 630-056), BSA (Sigma A3675). The flux buffer is vacuum-filtered and stored refrigerated for a maximum of 5 days. Before use in the experiment, the buffer is warmed at 37 °C in a waterbath.

Antagonists:

The test compounds were diluted in flux buffer and added to 4 wells of a black
10 microplate (4 parallel measurements per compound). The following control wells were used: 100% response control (no inhibition), flux buffer was added; 100% inhibition control: chemokine was added at 5-times the concentration required to induce a Ca flux.

Preparation of the agonist (chemokine) plate

The chemokines are diluted in flux buffer to concentrations that are 4-fold higher
15 than the desired concentrations required for stimulation of the cells (i.e. 2.5 nM for SDF-1 α). The chemokines were added to untreated 96-well Sero well compound plates (International Medical, Sterilin code 611F96). In the negative control well's (baseline monitoring), flux buffer is added instead of chemokine. As a positive control to check for dye loading efficiency, 20 μ M digitonin (final concentration) was also included. The
20 agonist plate was incubated in the FLIPR (37 °C) for 15-30 min.

Cell loading protocol for measuring inhibition of SDF-1 α induced Ca flux in SUP-T1 cells.

SUP-T1 cells were centrifuged at room temperature (RT) and re-suspended in loading medium (RPMI-1640 containing 2% FBS and 4 μ M Fluo-3, AM). The cells were incubate at room temperature for 45 min. then washed twice in flux buffer then incubated
25 in flux buffer at room temperature for 10 min. The cells were centrifuged and re-suspended in flux buffer at a density of 3×10^6 cells per mL. A 100 μ L aliquot of the cell suspension (3×10^5 cells) was added to each well of a black microplate (Costar 3603), which already contains 50 μ L of a solution of the test compound (at concentrations that are 3-fold higher than the desired final compound concentrations). The microplate is then gently centrifuged
30 at room temperature. Homogeneous spreading of the cells on the bottom of the microplate wells was then confirmed with a microscope and the microplate was incubated in the FLIPR (37 °C) for 10 min. prior to testing.

Fluorescence measurements as a function of time on the FLIPR

The FLIPR settings (camera exposure time and laser power) are adjusted to obtain initial fluorescence values between 8,000 and 10,000 units. After monitoring a 20 second-baseline, the agonist (chemokine) (50 μ L) is added by automatic pipettor with black pipette tips. Fluorescence is measured simultaneously in all wells of the microplate every 2
5 seconds (first 2 min) and thereafter every 6 seconds (additional 2 min). The average Ca^{2+} -flux measured in each set of 4 identical wells (one test compound) was calculated by the FLIPR software.

Using the above method, the compounds of the current invention were found to inhibit SDF-1 α induced Ca^{2+} flux in SUP-T1 cells between 0-100% at a fixed concentration
10 of 5 μ g/mL.

EXAMPLE 102

Assay for inhibition of HIV-1 (NL4.3) replication in MT-4 cells.

15 Inhibition of HIV-1 NL4.3 (or III_B) replication assays were performed as previously described (Bridger et al. J. Med. Chem. 1999, 42, 3971-3981; De Clercq et al. Proc. Natl. Acad. Sci, 1992, 89, 5286-5290; De Clercq et al. Antimicrob. Agents Chemother. 1994, 38, 668-674; Bridger et al. J. Med. Chem. 1995, 38, 366-378). Anti-HIV activity and cytotoxicity measurements were carried out in parallel. They were based on the viability of
20 MT-4 cells that had been infected with HIV in the presence of various concentrations of the test compounds. After the MT-4 cells were allowed to proliferate for 5 days, the number of viable cells was quantified by a tetrazolium-based colorimetric 3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide (MTT) procedure in 96-well microtrays. In all of these assays, viral input (viral multiplicity of infection, MOI) was 0.01, or 100 times the
25 50% cell culture infective dose (CCID₅₀). The EC₅₀ was defined as the concentration required to protect 50% of the virus-infected cells against viral cytopathicity.

When compounds of the current invention were tested for inhibition of HIV-1 NL4.3 or III_B replication in MT-4 cells, they were found to exhibit EC₅₀'s of 0.002-20.0 μ g/mL.
